

Tuesday, 6 Feb

brought to you by the letters G R A V I T A T I O N

housekeeping

Wiki...I approve requests in bulk

Your mandatory book: Period 1:

Any time, but before 5 pm on January 26 enter the book that you've chosen into the appropriate Wiki page. Make a page in the Wiki for your review as per the instructions. (You can do this earlier!)

ISP220 Journalists: can we talk after class?

During Part 1:

I sure hope you're keeping up

More http server issues... keep me informed when it's not available

we have to fix it. a kludge installed now

this week:

9. gravitation

10. electric charge and magnetism

(next week's Tuesday topics)

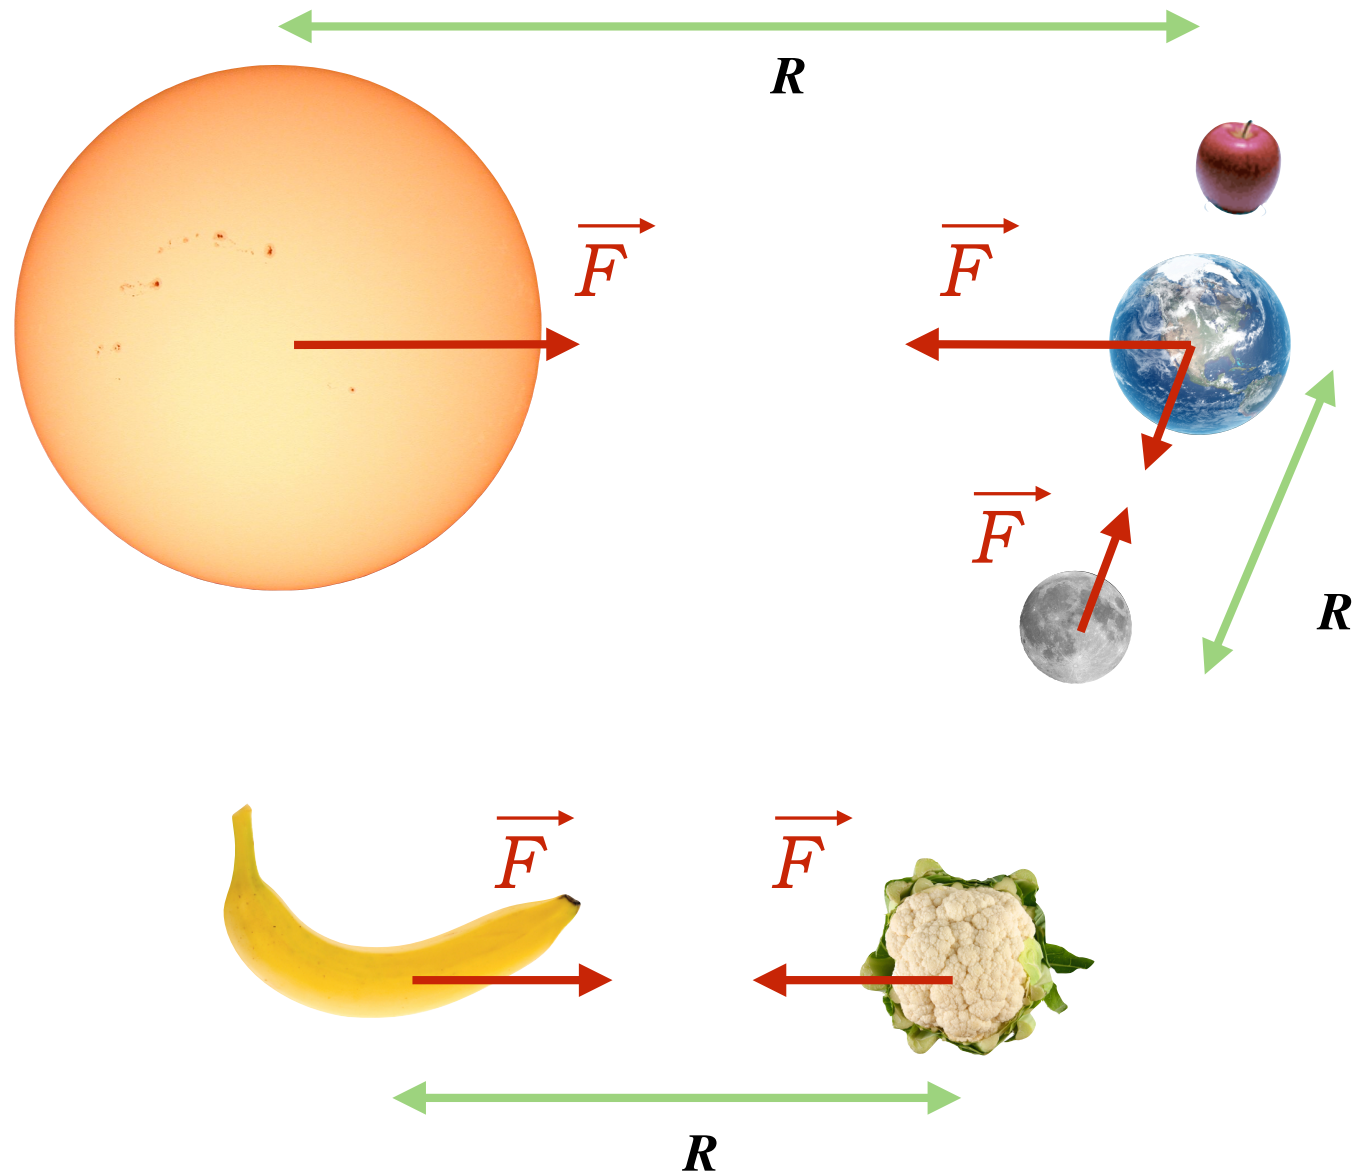

available Wednesday night:

11. Faraday's Fields

12. Maxwell's Fields

this changed everything

One thing: Newton's **Universal** law of Gravitation

this changed everything

$$\vec{F}_{1,2} = -\vec{F}_{2,1}$$

$$|\vec{F}_{1,2}| = |\vec{F}_{2,1}| = F$$

$$F = G \frac{m_1 m_2}{R^2}$$

$$G = 6.67300 \times 10^{-11} \text{ m}^3 \text{ kg}^{-1} \text{ s}^{-2}$$

“Gravitational Constant”

follow-on to Newton

impact changed western civilization

no lie.

Newton's telescope design

many solar-system discoveries

original 6 objects: Mercury, Venus, Earth, Moon, Mars, Jupiter, Saturn

17th century: 4 Jupiter moons, 5 Saturn moons

18th century: Uranus, 2 Uranus moons, 2 more Saturn moons

19th century: Neptune, 1 Neptune moon, 2 more Saturn moons, 2 Mars moons, 1 Jupiter moon

20th century: 12 more Jupiter moons, 7 Neptune moons, Pluto, 12 more Saturn moons, 16 Uranus moons

21st century: 35 more Saturn moons, 35 more Jupiter moons, 7 more Neptune moons, 4 Pluto moons, 7 more Uranus moons, plus a brand new planet (last week)?

+ >2000 exoplanets

predictions and confirmations **galore**

Resistive media

tides (moon and earth)

oblateness of the earth (if it rotates)

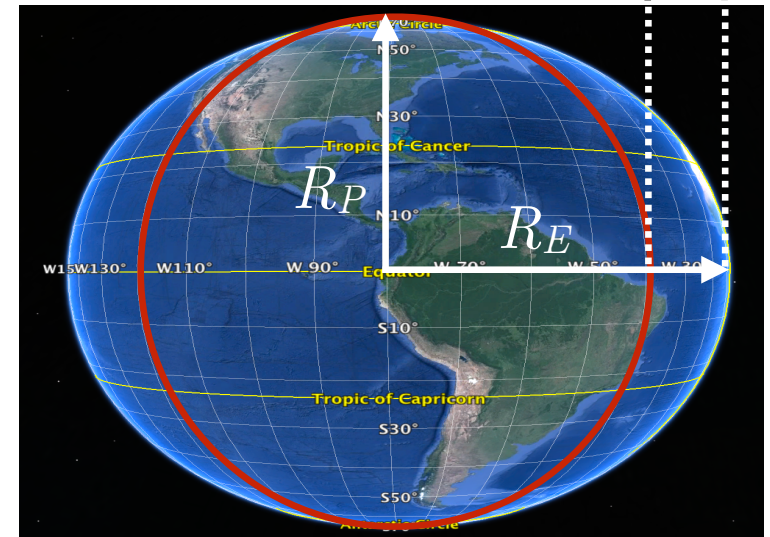

little g different at equator than north or south

1 degree longitude measured in Lapland by Pierre de Maupertius in 1736

"precession of the equinoxes" because of top-like wobbling of the earth's axis

method to determine the path of a comet with 3 measurements

$$R_E - R_P \sim 13 \text{ miles}$$

$$N: R_E = (231/230) R_P$$

(now 301/300)

from a theory to a rule

by 1840, it was clear that something was wrong with the orbit of Uranus

Two mathematically inclined astronomers used Newton's model to calculate the position of a presumed new planet!

Neptune:
1846...found almost immediately in Berlin

Calculating Uranus' orbit due to the biggest masses around...? nope

absurdly not to scale!

Mercury's orbit is weird

Vulcan?

nope

okay.

There's only been one other person in the history of physics as revolutionary as Isaac Newton

mercury plays a role

one manipulation...and our project

T-shirt equation:

$$F_{1,2} = m_1 a$$

$$\frac{v^2}{R}$$

for a circular path:

Gravitation:

$$G \frac{m_1 m_2}{R^2}$$

put them together:

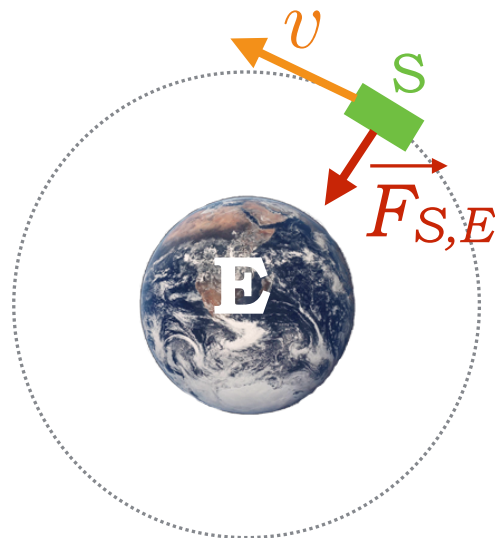

any gravitationally-bound object

say a satellite (S) orbiting the earth (E)

$$F_{S,E} = G \frac{M_E M_S}{R^2}$$

$$G \frac{M_S M_E}{R^2} = M_S \frac{v^2}{R}$$

$$\cancel{G \frac{M_S M_E}{R^2}} \times \cancel{R} = \cancel{M_S \frac{v^2}{R}} \times \cancel{R}$$

$$v^2 = G \frac{M_E}{R}$$

$$v = \sqrt{G \frac{M_E}{R}}$$

answer, defend

Force on satellite due to earth:

$$F_{S,E} = G \frac{M_E M_S}{R^2}$$

$$v^2 = G \frac{M_E}{R}$$

as the **distance** goes up,
the speed:

A

increases

B

stays the same

C

decreases

D

answer, defend

Force on satellite due to earth:

$$F_{S,E} = G \frac{M_E M_S}{R^2}$$

$$v^2 = G \frac{M_E}{R}$$

as the **speed** goes up,
the distance:

A

increases

B

stays the same

C

decreases

D

now go back to yesteryear of NASA

DOCKING!!

$$v^2 = G \frac{M_E}{R}$$

Gemini V

June 1965

James McDivitt and Ed White

quiz

docking...strange: "Hohmann Transfer": 2 days

$$v^2 = G \frac{M_E}{R}$$

**now one of the 2 biggest problems in all of physics
and astronomy**

Andromeda Galaxy, aka M31

something is terribly wrong

with stellar and galactic motions

Coma cluster of galaxies

Fritz Zwicky, 1933

something's there

$$v = \sqrt{G \frac{M_{\text{galaxy center}}}{R}}$$

Vera Rubin, w/ Kent Ford,
1970: Andromeda

too fast!

Something's wrong! The amount of mass required in order to match the motion is about 1/6 of what is observable.

TWO DISC 20TH ANNIVERSARY EDITION

LLOYD KAUFMAN AND MICHAEL HERZ PRESENT A TROMA TEAM RELEASE

THERE'S NOTHING OUT THERE!

A ROLFE KANEFSKY FLICK

"NOTHING has a lot going for it!"

Los Angeles Times

it's darker than you think

something is out there

it doesn't shine

visible light, X-rays, Infrared, UV...nothing.

so it's not regular atoms

But. It gravitates.

silver bullet(s)

Bullet Cluster

Telescope and the
Chandra X-ray
Observatory

simulation-inspired artistic view
of milky way...blue is the amount
of dark matter required

<https://www.youtube.com/watch?v=mRTGUCLjQ3w>

Simulation...

if it's not a particle

then, we're completely lost

which would be...you know...kind of cool

DARK MATTER

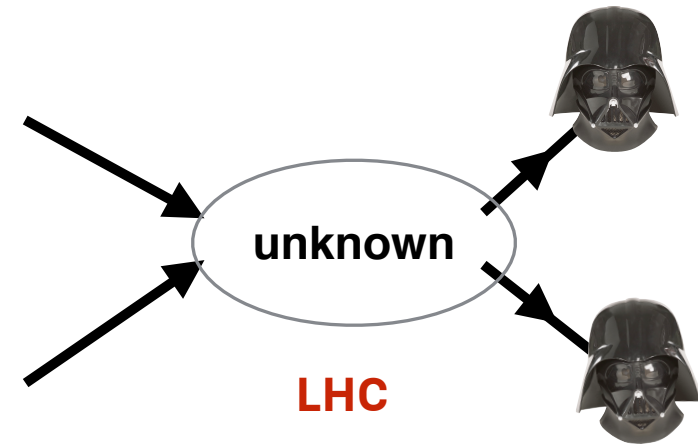

everywhere

So there must be little Dark Matter particles:

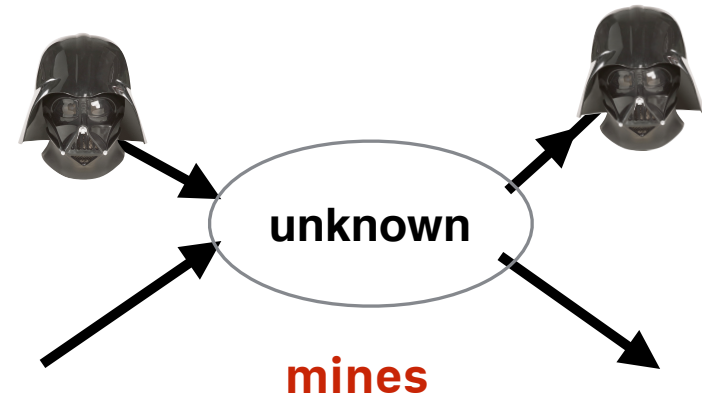

experiments

production

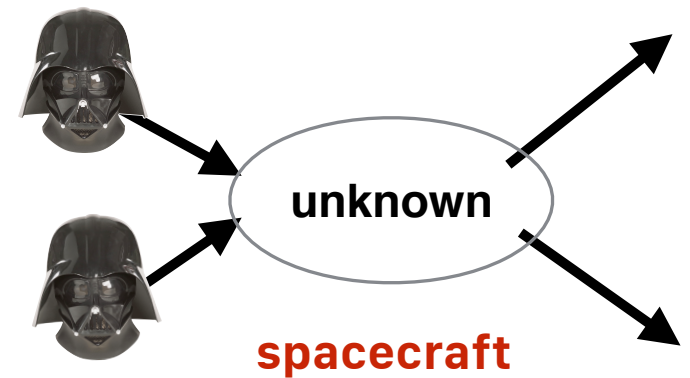

on the Earth, in orbit, and deep under the Earth's surface

direct detection

indirect detection

hypothetical

Dark Matter

≈ 0

? - but perhaps 30% of the universe

?

something entirely new

projects

$$v = \sqrt{G \frac{M_{\text{center}}}{R}}$$
