

# Day 28, 24.04.2018 Particle Physics 3 & Cosmology 5

# housekeeping

The end game: next slide

**Particle Physics:** 

**Readings**: Oerter, Cosmic Horizons, and Hobson

Hobson\_quantum\_fields.pdf is chapter 17

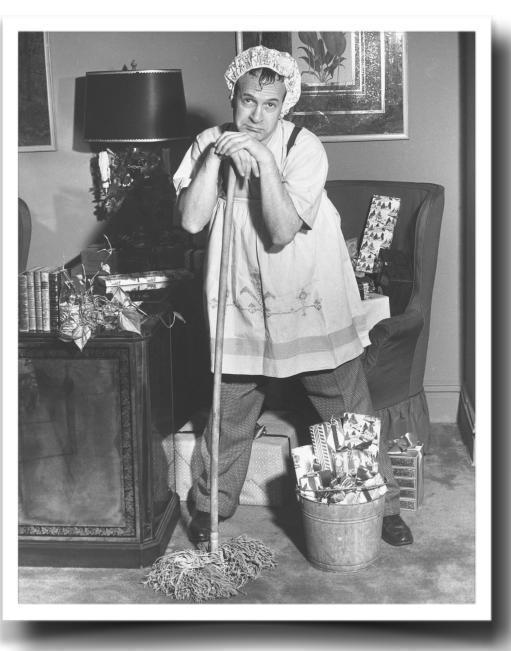

Homework #13 is: partly from MasteringPhysics - normal due date

partly on paper...see the blog

Feynman Diagram rules

3 movies in the lecture slide directory - you'll need them for homework and the final

they are: primitiveDiagrams\_X. mp4

### 2

### where X = 0, 1, 2

# last 2 1 weeks & final

Homework #13 will be assigned 4/21 and due 4/28 - normal rotation

On-line final exam will be assigned Sunday, 4/29 and due Tuesday night, May 1

will cover material since midterm plus the last week of class

There is 1 more 10 point quiz (stay tuned)...

only the shadow knows when...actually, watch the blog. Quiz up tomorrow, return Thursday in class.

### Remember when I was sick?

been trying to catch up, but not going to make it. Hence:

### Final Exam day:

- 1. You'll arrive at 0745 on May 4, here. I know.
- 2. I'll provide bagels. You supply liquids.
- 3. We'll have a quiz.
- 4. I'll finish with about a 1 hour grand finale, lalapalooza, mind-bending lecture
- 5. You'll do your Feynman Diagram Project
- 6. There will be no poster project this year

# I'm did rethink this, do it by May 4th midnight, but no

# now hear this:

Student Instruction Rating System (SIRS Online) collects student feedback on courses and instruction at MSU. Student Instructional Rating System (SIRS Online) forms will be available for your students to submit feedback during the dates indicated:

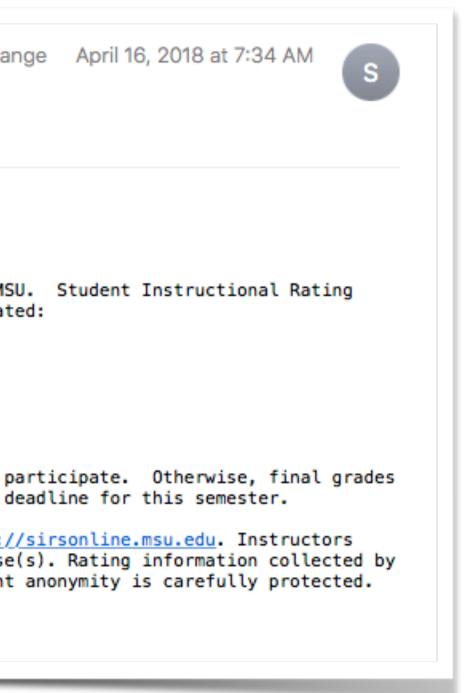

ISP 220 001: 4/16/2018 - 5/16/2018 ISP 220 002: 4/16/2018 - 5/16/2018

Direct students to <a href="https://sirsonline.msu.edu">https://sirsonline.msu.edu</a>.

Students are required to complete the SIRS Online form OR indicate within that form that they decline to participate. Otherwise, final grades (for courses using SIRS Online) will be sequestered for seven days following the course grade submission deadline for this semester.

SIRS Online rating summaries are available to instructors and department chairs after 5/16/2018 at <a href="https://sirsonline.msu.edu">https://sirsonline.msu.edu</a>. Instructors should provide copies of the rating summaries to graduate assistants who assisted in teaching their course(s). Rating information collected by SIRS Online is reported in summary form only and cannot be linked to individual student responses. Student anonymity is carefully protected.

If you have any questions, please contact Michelle Carlson, (mcarlson@msu.edu, (517)432-5936).

# honors project began

https://qstbb.pa.msu.edu/storage/Homework\_Projects/honors\_project\_2018/

contains:

the first instructions: the plan & tutorial the second instructions -v2 uploaded, added a missing student the data, assigned by name in the second instructions - see next

dates:

complete first part, March 16

analyze data by April 24 and hand in complete writeup at the final exam

# have I need a Section 2

### to test the Z-path uploading machinery and instructions

working on it. I'll be in touch via email.

# nd instructions email.

# here's what we've learned

There are three kinds of fields: messenger fields, quark fields, and lepton fields

oscillations - the particles - of quark fields are the constituents of protons and neutrons, but also hundreds of other "particles" that nature will produce

oscillations of lepton fields - electrons and the electron neutrino and the other two lepton pairs, round out "matter"

Messenger fields carry the four known forces from one particle to another

# the now jargon

# gets a little more straightforward

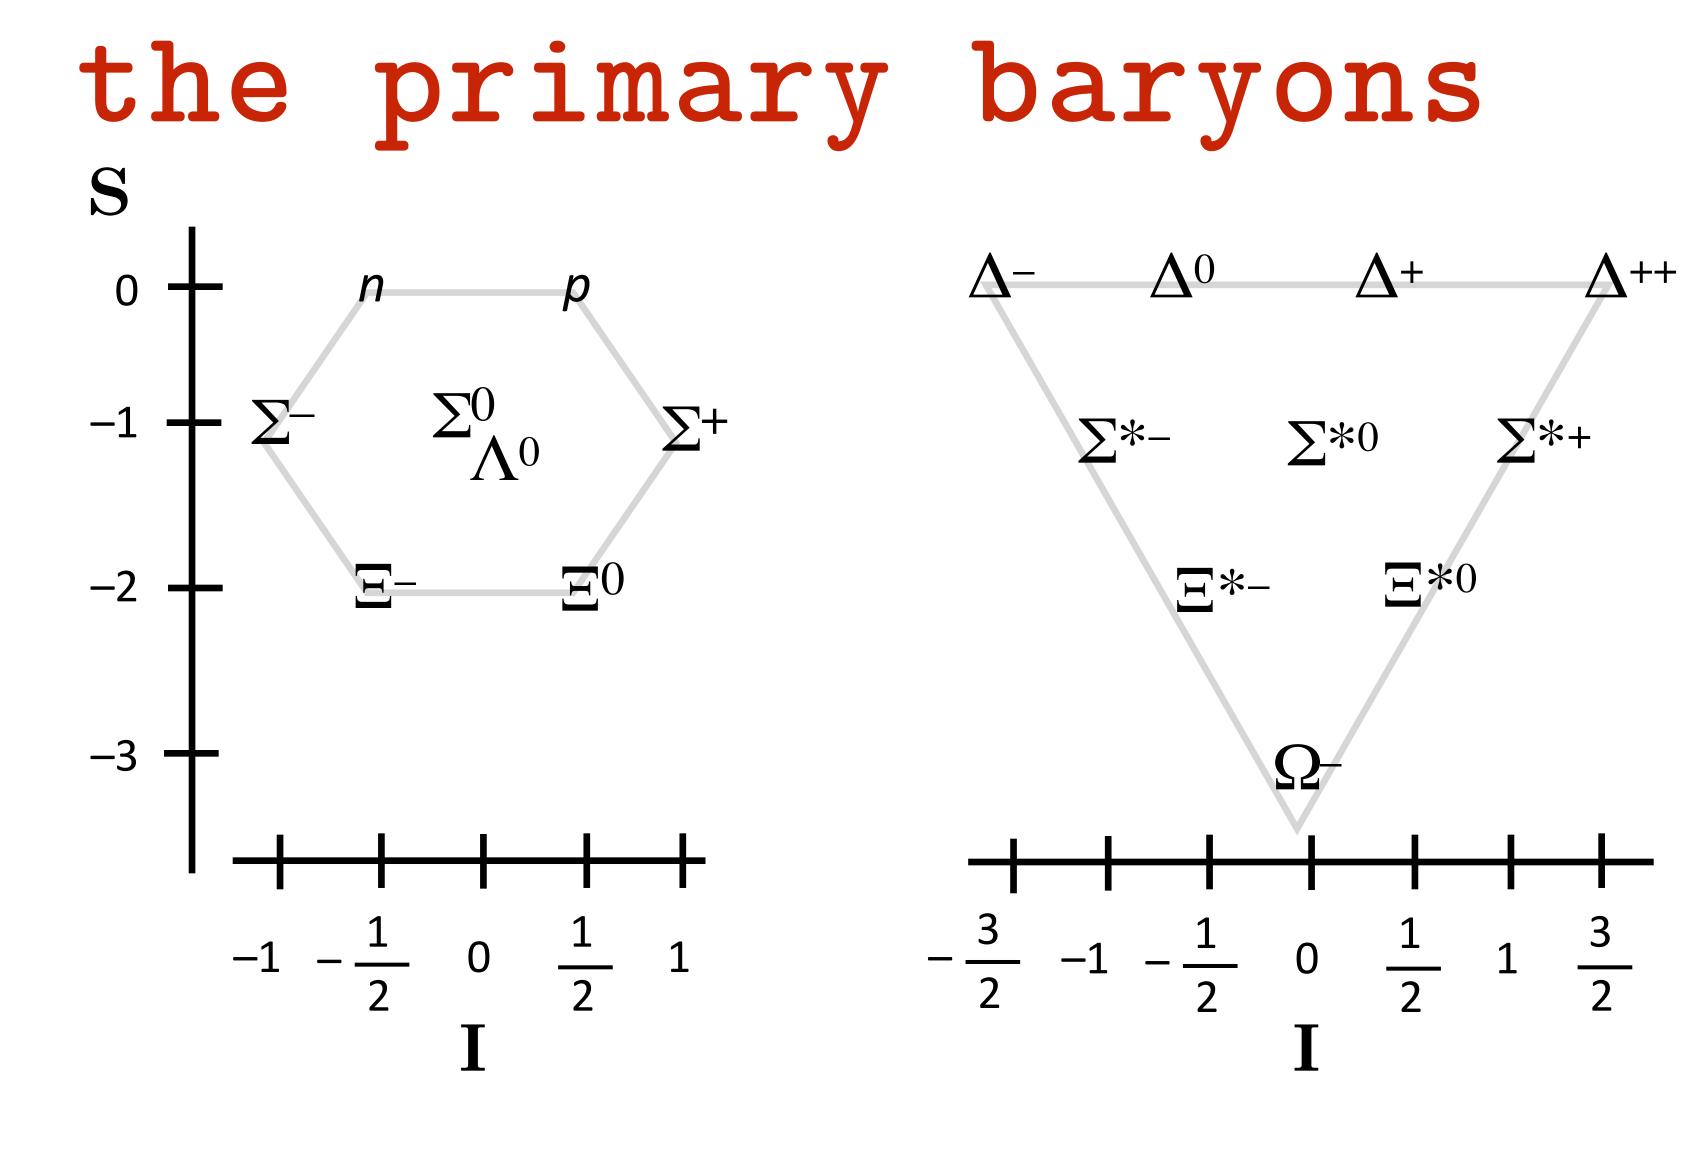

### Hadrons: particles made of quarks.

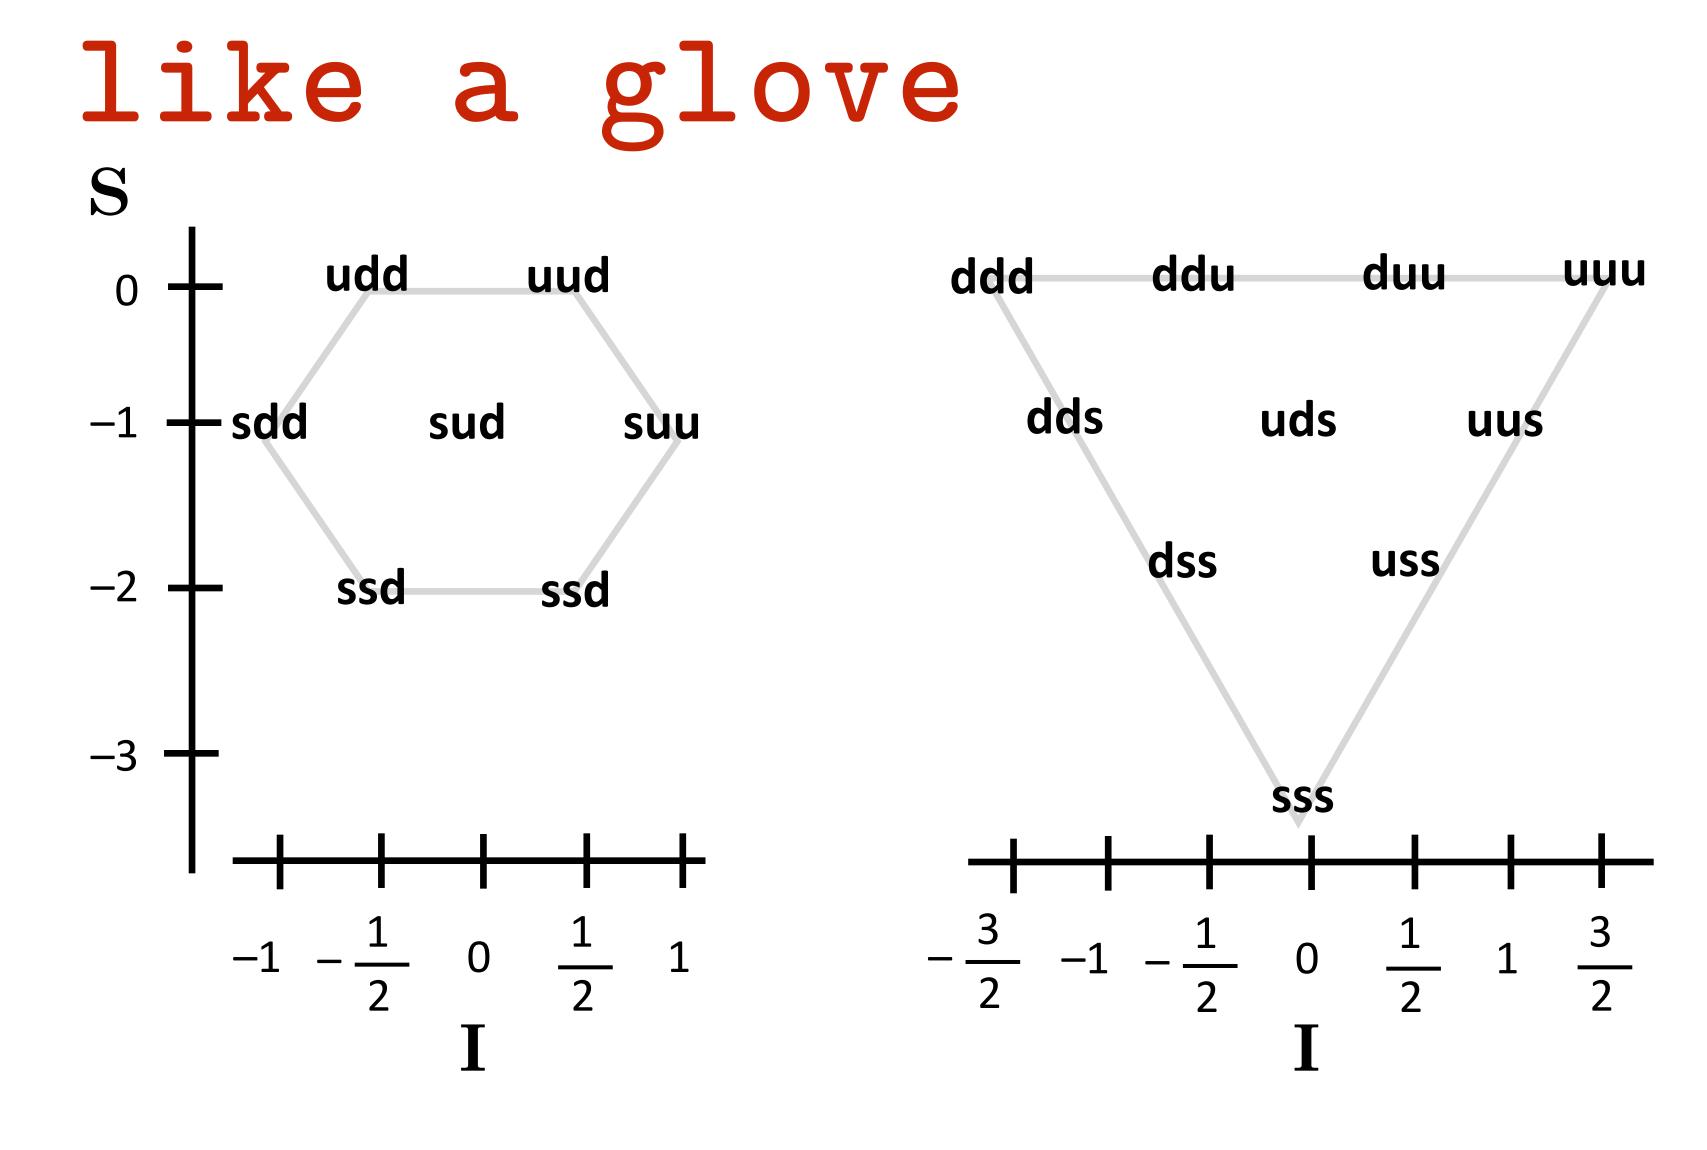

Baryons: particles made of 3 quarks.

now defined:

now defined:

**Mesons**: particles made of 1 quark and 1 antiquark.

# the dominant Baryons

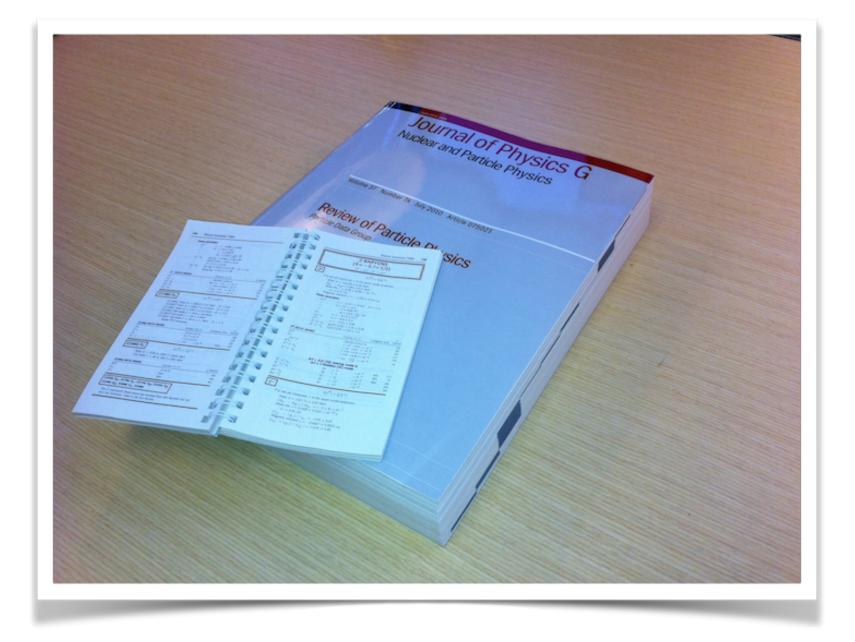

| Particle | Symbol        | Rest Mass<br>MeV/c <sup>2</sup> | spin | Q  | В  | S  | Lifetime                 | dominant decay<br>modes      | quark content |

# shifting gears

the weak and electromagnetic forces are one.

# "phase transitions"

## not a subject of **Particle Physics**

we thought

but we stole a theory from materials scientists

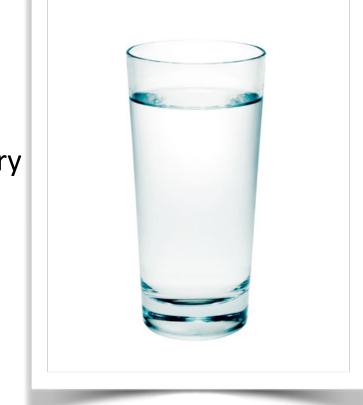

when there has been a symmetry change, that's essentially the definition of a phase change: Pierre Curie

before: every direction is identical

think about a phase transition

### what a physicist sees is a change of symmetry

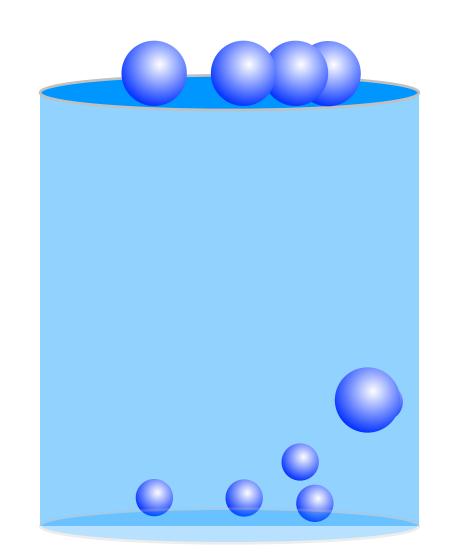

after: now there are special directions

there are basically 2 kinds

1st Order nucleation

2d Order continuous

Boiling starts in various locations inside of liquid water

Other kinds of phase transitions happen uniformly throughout the substance.

you probably are mostly familiar with: freezing melting boiling

These "2nd Order," phase transitions are continuouseverywhere:

crystallization changes of density magnetism superconductivity superfluidity plasma transition electron gases Bose gases

# ferromagnet

most familiarly:

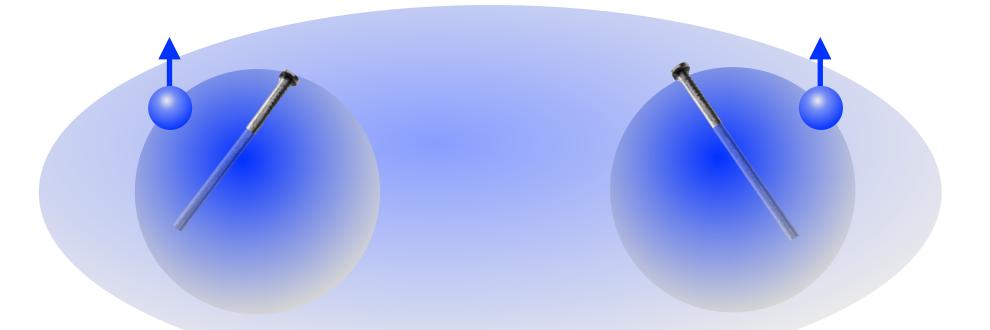

iron

a

also:Co, Ni, Li gas

many compounds

If atoms are far apart...a quantum mechanical effect keeps the spins aligned, minimizing the electrostatic energy

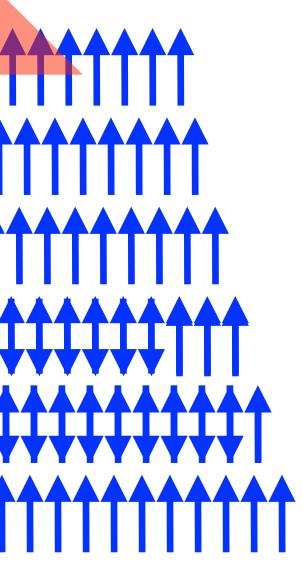

if the atoms are attached to an Iron lattice... the spins can add up

# that's a permanent ferromagnet

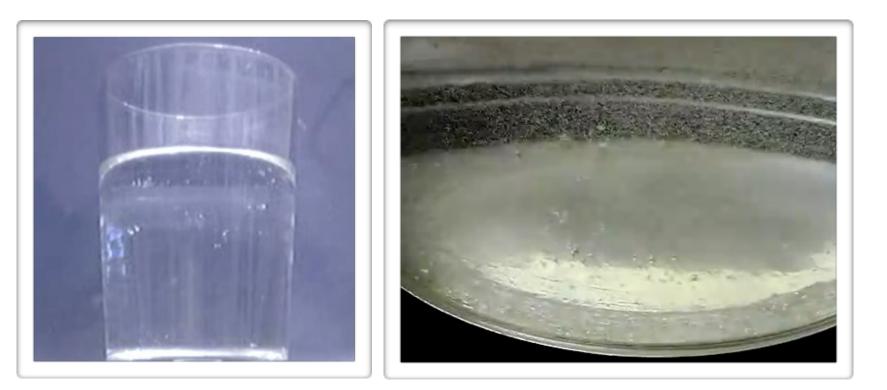

## in 2 - dimensions

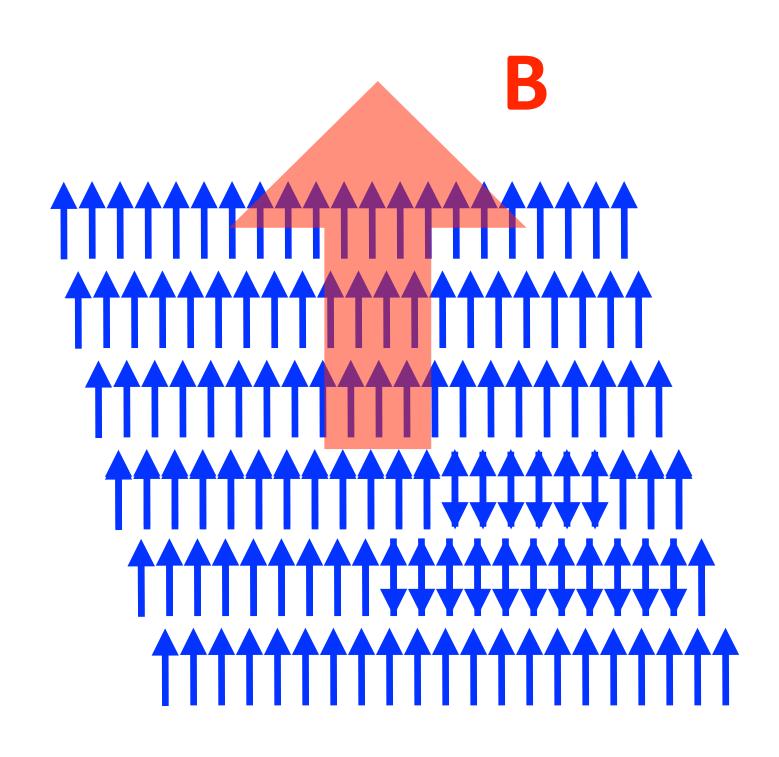

### is he talking about phase transitions you're asking yourself?

4.2 K - liquifies 2.17 K - superfluid

a little model of an ideal ferromagnet

in one – dimension At a low temperature – like room temperature:

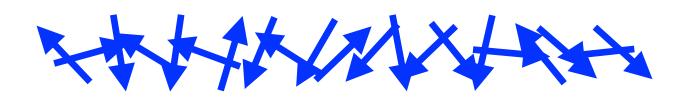

**M** is maximum

**M**, "magnetization": a measure of how magnetized

"ground state" – state of lowest energy –

when all electronic magnets are aligned

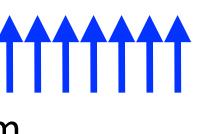

There is a high temperature – the "Curie Point":

then the "ground state" – state of lowest energy –

when all electronic magnets are random

M becomes zero

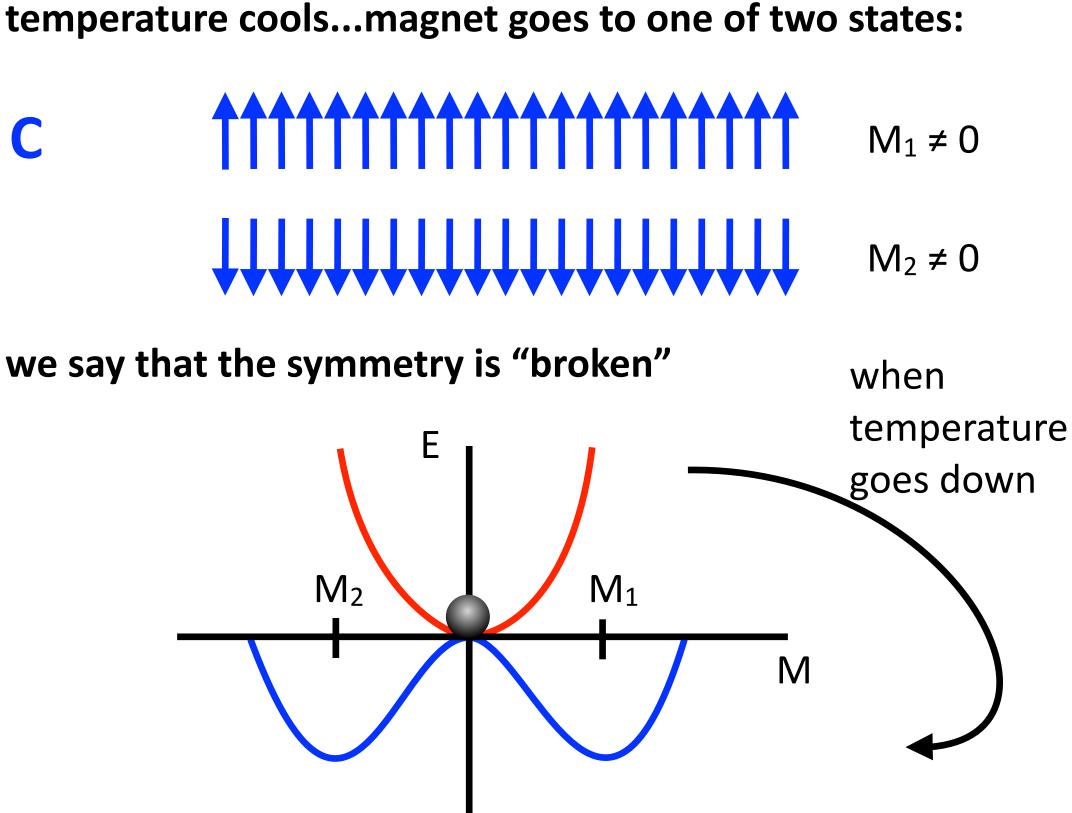

### an

# important difference

# C

we say that the symmetry is "broken"

the energy level of the **hot ground state** is higher than the energy level of the cold ground state

# between these two situations

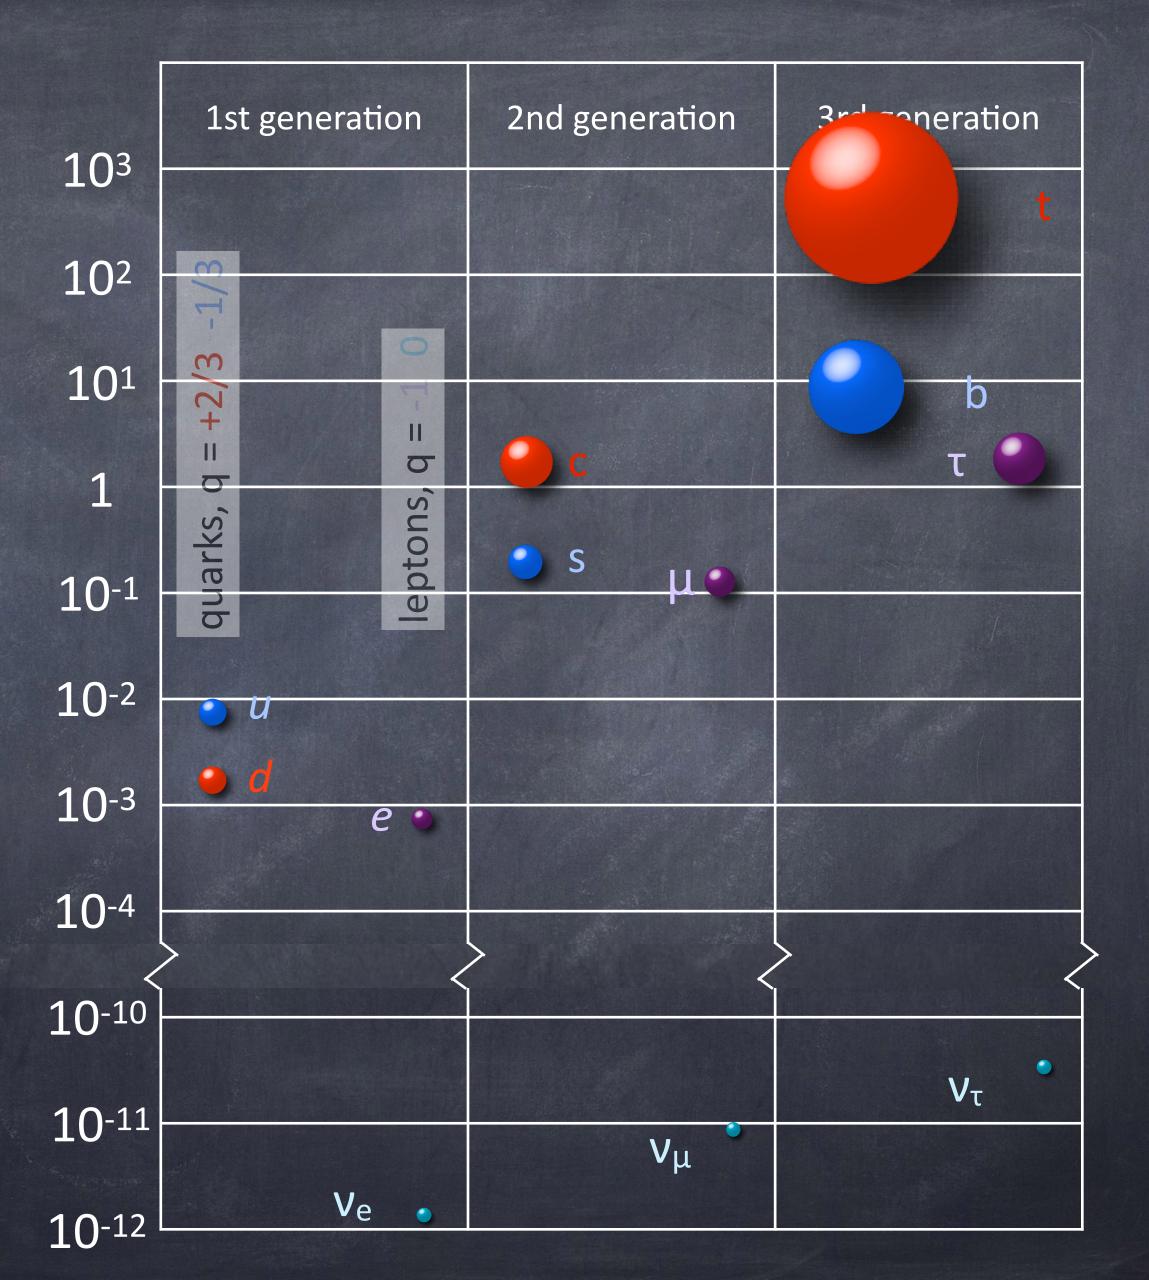

### M = 0

# this often-told magnet story

evolves into the new story of MASS

# quarks & leptons

### proton masses

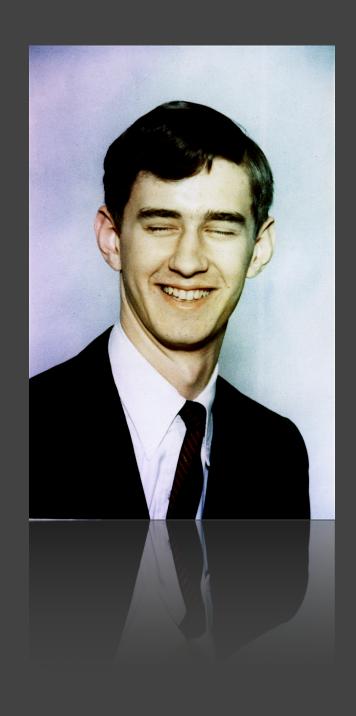

# the only mathematical solution that made sense:

masses of all quarks, leptons, and messenger particles

= 0

until we stole the magnet story and rewrote it into our book

### A MODEL OF LEPTONS

Leptons interact o the intermediate bos diate weak interaction natural than to unite<sup>1</sup> th into a multiplet of gauge the way of this synthesis ar

ferences in the masses of the parameters in the masses of the parameters in the masses of the parameters may be imagining that the symmetries relating the weak and electromagnetic interactions are exact symmetries of the Lagrangian but are broken by the vacuum. However, this raises the specter of unwanted massless Goldstone bosons.<sup>\*</sup> This note will describe a model in which the symmetry between the electromagnetic and weak interactions is spontaneously broken, but in which the Goldstone bosons are avoided by introducing the photon and the intermediate-boson fields as gauge fields.<sup>\*</sup> The model may be renormalizable.

We will restrict our attention to symmetry groups that connect the <u>observed</u> electron-type leptons only with each other, i.e., not with muon-type leptons or other unobserved leptons or hadrons. The symmetries then act on a lefthanded doublet

 $L = \left[\frac{1}{2}(1+\gamma_5)\right] \begin{pmatrix} \nu e \\ e \end{pmatrix}$ 

Steven Weinberg† Nuclear Science and Phys ate of Technology, Camb aceived 17 October 3

(2)

(3)

At leaves invariant the kine-  $\partial_{\mu}L - \overline{R} \gamma^{\mu} \partial_{\mu}R$  of the Lagrangthe electronic isospin  $\overline{T}$  acting numbers  $N_L$ ,  $N_R$  of left- and

as we know, two of these symmetries are entirely unbroken: the charge  $Q = T_3 - N_R - \frac{1}{2}N_L$ , and the electron number  $N = N_R + N_L$ . But the gauge field corresponding to an unbroken symmetry will have zero mass,<sup>4</sup> and there is no massless particle coupled to N,<sup>5</sup> so we must form our gauge group out of the electronic isospin  $\vec{T}$  and the electronic hyperchange  $Y = N_R$  $+ \frac{1}{2}N_L$ .

Therefore, we shall construct our Lagrangian out of L and R, plus gauge fields  $\vec{A}_{\mu}$  and  $B_{\mu}$  coupled to  $\vec{T}$  and Y, plus a spin-zero doublet

whose vacuum expectation value will break  $\vec{T}$ and Y and give the electron its mass. The only renormalizable Lagrangian which is invariant under  $\vec{T}$  and Y gauge transformations is

$$= -\frac{1}{4} (\partial_{\mu} \vec{A}_{\nu} - \partial_{\nu} \vec{A}_{\mu} + g \vec{A}_{\mu} \times \vec{A}_{\nu})^{2} - \frac{1}{4} (\partial_{\mu} B_{\nu} - \partial_{\nu} B_{\mu})^{2} - \bar{R} \gamma^{\mu} (\partial_{\mu} - ig' B_{\mu}) R - L \gamma^{\mu} (\partial_{\mu} ig \vec{t} \cdot \vec{A}_{\mu} - i \frac{1}{2} g' B_{\mu}) L$$
$$- \frac{1}{2} (\partial_{\mu} \varphi - ig \vec{A}_{\mu} \cdot \vec{t} \varphi + i \frac{1}{2} g' B_{\mu} \varphi )^{2} - G_{\rho} (\bar{L} \varphi R + \bar{R} \varphi^{\dagger} L) - M_{1}^{2} \varphi^{\dagger} \varphi + h(\varphi^{\dagger} \varphi)^{2}.$$
(4)

(1)

We have chosen the phase of the R field to make  $G_{\mathcal{C}}$  real, and can also adjust the phase of the L and Q fields to make the vacuum expectation value  $\lambda = \langle \varphi^0 \rangle$  real. The "physical"  $\varphi$  fields are then  $\varphi^-$ 

1264

We see immediately that the electron mass is  $\lambda G_e$ . The charged spin-1 field is

$$V_{\mu} = 2^{-1/2} (A_{\mu}^{1} + iA_{\mu}^{2})$$

(6)

ectation value

comes

$$M_W = \frac{1}{2}\lambda g.$$
 (9)

The neutral spin-1 fields of definite mass are

$$Z_{\mu} = (g^{2} + g'^{2})^{-1/2} (gA_{\mu}^{3} + g'B_{\mu}), \qquad (10)$$

$$A_{\mu} = (g^2 + g'^2)^{-1/2} (-g' A_{\mu}^{\ 3} + g B_{\mu}). \tag{11}$$

Their masses are

$$M_Z = \frac{1}{2}\lambda (g^2 + g'^2)^{1/2},$$
 (12)

M<sub>A</sub>=0, (13)

so  $A_{\mu}$  is to be identified as the photon field. The interaction between leptons and spin-1 mesons is

H.c. + 
$$\frac{igg'}{(g^2 + g'^2)^{1/2}} \bar{e} \gamma^{\mu} e A_{\mu}$$
  
+  $\frac{i(g^2 + g'^2)^{1/2}}{4} \left[ \left( \frac{3g'^2 - g^2}{g'^2 + g^2} \right) \bar{e} \gamma^{\mu} e - \bar{e} \gamma^{\mu} \gamma_5 e + \bar{\nu} \gamma^{\mu} (1 + \gamma_5) \nu \right] Z_{\mu}.$  (14)

upling constant is  $1/2 = 2.07 \times 10^{-6}$ .

ons is stronger by a very weak. Note al-'larger than e, so BeV, while (12) gives

ew predictions made

by this model have to do with the couplings of the neutral intermediate meson  $Z_{\mu}$ . If  $Z_{\mu}$ does not couple to hadrons then the best place to look for effects of  $Z_{\mu}$  is in electron-neutron scattering. Applying a Fierz transformation to the *W*-exchange terms, the total effective  $e - \nu$  interaction is

$$\frac{G_W}{\sqrt{2}} p_{\gamma_\mu} (1+\gamma_5) \nu \left\{ \frac{(3g^2-g'^2)}{2(g^2+g'^2)} \overline{e} \gamma^\mu e + \tfrac{3}{2} \overline{e} \gamma^\mu \gamma_5 e \right\}.$$

If  $g \gg e$  then  $g \gg g'$ , and this is just the usual  $e \cdot \nu$  scattering matrix element times an extra factor  $\frac{3}{2}$ . If  $g \simeq e$  then  $g \ll g'$ , and the vector interaction is multiplied by a factor  $-\frac{1}{2}$  rather than  $\frac{3}{2}$ . Of course our model has too many arbitrary features for these predictions to be

1265

 $I_Z > M$  iv and  $M_Z > 80$  BeV. The only uncouly call new

### of particle physics

## the story of the Higgs Boson a story about nothing.

This quickly became a story of a particular epoch in the early Universe which itself underwent a phase transition

48

### Not in your average hunk of iron

## the "system"? the enthative region to the whole enchilada

the phase transition?

everywhere in the Universe

there was a phase change in the entire Universe

at about 1 picosecond after the big bang

there were PRIMORDIAL fields and particles before (hot)

and different fields and particles after (cold)

С

we live in the resulting "cold" universe

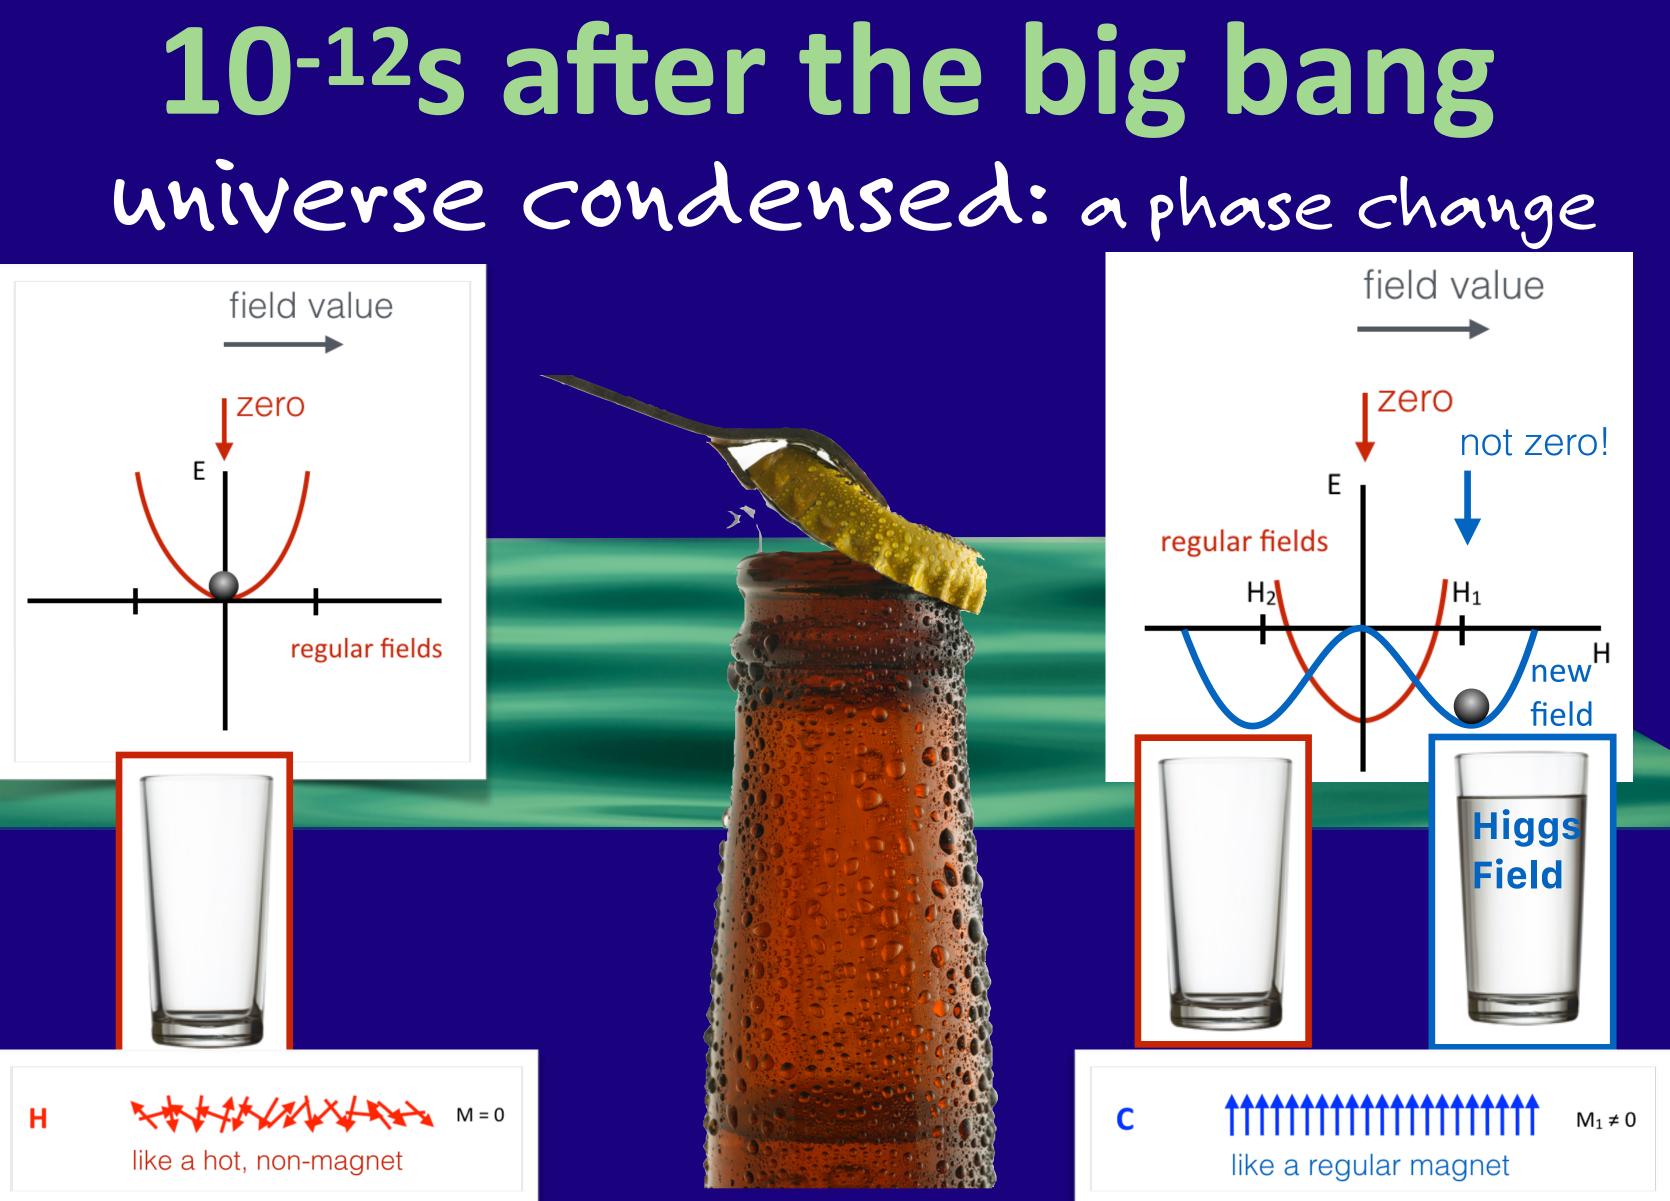

### \*\*\*\*\* like a regular magnet

M₁ ≠ 0

50

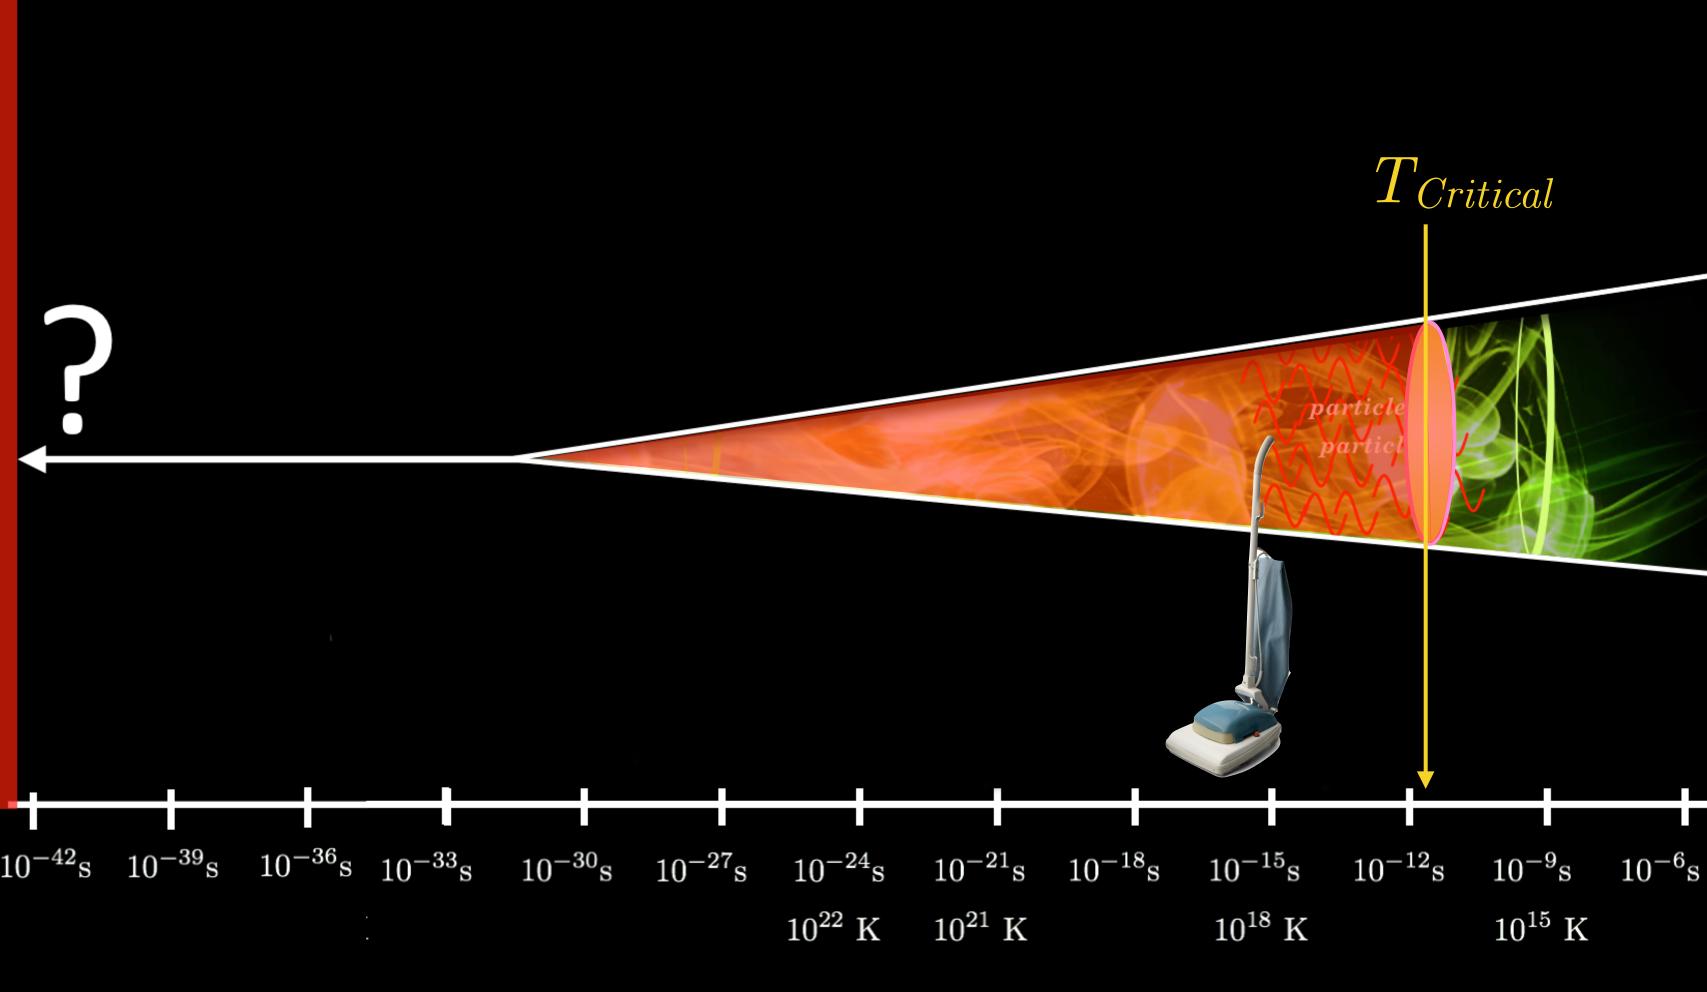

# the big story of the Standard Model

is the story of mass.

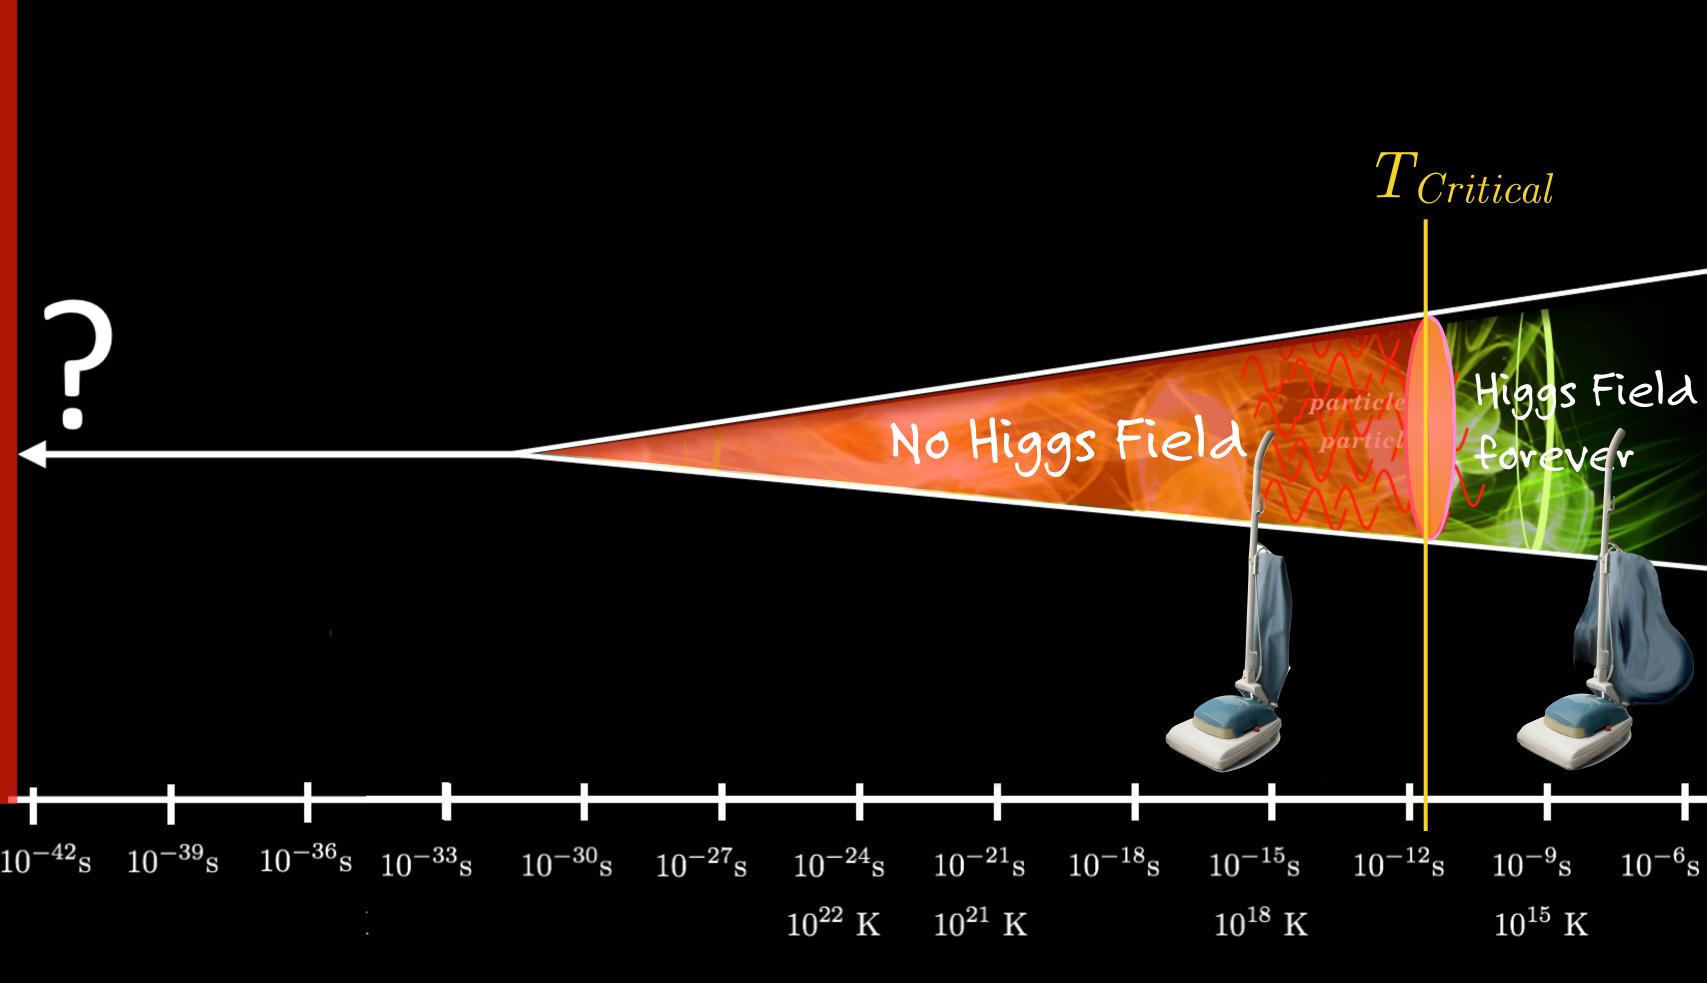

### elementary particle epoch

# Cosmology 5

"Steady State Universe"

eternal, matter created out of vacuum to maintain constant energy density...

"Big Bang Universe"

universe began at an instant

I lied: cyclic universe

over and over...bang and collapse - so eternal and a beginning

105

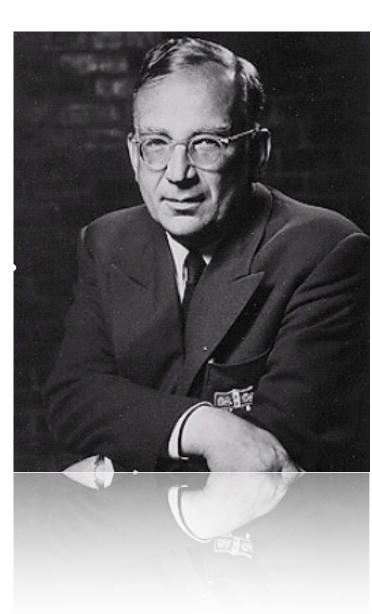

George Gamow

universe born

hot primordial soup

# Fred Hoyle

steady state model, continuous creation of matter.

To Hoyle: the Big Bang implied a creator.

106

The recession of the galaxies does not give the only observational test that a theory of the expanding universemust satisfy. During the past few years astronomers have developed a number of further requirements. Although I don't wish to go into these in detail, I might mention that it is now possible to determine the ages of our own Galaxy and of several neighbouring galaxies with a substantial degree of accuracy. The result is about five thousand million years. A satisfactory theory must provide for this age, neither more nor less.

We not come to the question of applying the observational insts to earlier theories. These theories were based on the hypothesis that all the matter in the universe was created in one bigh bang at a particular time in the remote past. It now turns out that in some respect or other all such theories are in conflict with the observational requirements. And to a degree the can hardly be ignored. Investigators of this problem are like a party or containeers attempting an unclineed peak. Previoualy it had seemed as if the main difficulty was to decide between a <u>number of routes</u>, all of which seemed promising lines of ascent. But now we find that each of these routes peters out in seemingly hopeless precipices. A new way must be found. The new many way I am now going to discuss involves the hypothesis that matter is created continously.

How are the difficulties facing former theories overcome by introducing continuous creation of matter?

I cannot deal fully with this question, but perhaps you may like to hear one of many possible examples. According to the majority of the earlier theories the density of the matter which composes the background, the background which I've already described, must in the distant past, have been vastly greater than it is at present. This is an effect arising from the expansion, which in these theories produces a decrease of background density as we go forwards into the future but an

# "Big Bang" was coined by Fred Hoyle in a

BBC radio broadcast for the general public in 1948

Big Bang cosmology is a form of religious fundamentalism ...and this is why these peculiar states of mind have flourished so strongly over the past quarter century. It is the nature of fundamentalism that it should contain a powerful streak of irrationality and that it should not relate, in a verifiable, practical way, to the everyday world. ...it would take an eternity of time to distill even one drop of sense...Big bang cosmology refers to an epoch that cannot be reached from any form of astronomy...

# Home is Where the Wind Blows 1994.

Fred Hoyle <u>d Blows</u> 1994.

## Sorry, Fred.

Here's the current understanding of the life of a Universe:

evolving in time and temperature.
